1. *Magic 8 Ball:* You are debugging an application in execution using gdb on a 64-bit (i.e. pointers use 64 bits), little-endian architecture. The application has a variable called *magic8ball* - defined as

char magic8ball[8][8][8];

Using gdb you find the following information at a particular stage in the application:

(gdb) p &magic8ball \$1 = (char (*)[8][8][8]) 0x7ffffffe000

And:

(gdb) x/512bx 0x	x7ffffff	fe000						
0x7fffffffe000:	0x4e	0x65	0x76	0x65	0x72	0×00	0×00	0x00

If the application were to output the value of magic8ball[3][4] – what would it be? i.e. what would be returned from the statement printf("%s", magic8ball[3][4]);
